

CONFIDENTIAL

VC/NVA LOGISTIC REQUIREMENTS

1. Introduction

This is a study of the basic load of weapons, ammunition, and certain communications equipment for NVA and VC units. Information available for this study included: Captured enemy documents, VC captive reports, VC returnee reports, and reports produced by other agencies.

Methodology

The documents and reports mentioned in paragraph one were screened for any information concerning basic load of weapon, ammunition, communications equipment and unit strengths. This information was tabulated on each type unit that has been identified (see tables 2, 3 and 4). From this tabulation it was determined how many rounds of ammunition are issued as a basic load for each type weapon. After the number of weapons was determined along with the number of rounds with each weapon these totals were multiplied by the weight of each type round to determine the total weight of ammunition. Table 1 is a tabulation of the various type weapons giving basic load per weapon and the weight of each type round. The only other type equipment that was considered in this study was signal equipment and these weights, derived from FM 101-10, "Staff Officer's Field Manual Organization, Technical, and Logistic Data", are also included in table 1. Tables 2, 3 and 4 are tabulations of squad, platoon and company size units that were extracted from the documents and reports. The source of each of these extractions is included in these tables and constitutes the bibliography for this study.

Once the weights of ammunition per weapon was determined this was applied to "Type" NVA units up to and including divisions to determine logistical requirements. Figures 1 thru 5 show the NVA Infantry Co., Combat Support Company, Infantry Battalion, Regiment and Division along with their basic load of Class V supplies.

Examination of all available data clearly shows that the strength of those VC main forces infantry battalions that are armed with the new 7.62 family of weapons (estimated to be some 30% of all main force infantry units) are about 70-80% the strength of an NVA infantry battalion. The

(CONTINUED)

Army review(s) completed.

remaining VC main and local force infantry battalions are 60-70% the strength of NVA units and are armed with older weapons of various origin thus complicating the logistical problems. VC combat support units were found to be generally comparable in strength to NVA combat support units.

3. Conclusions

Analysis of available data indicates that:

- a. The NVA Infantry Bn Strengths in SVN average about 647 men when at full strength.
- b. The Basic Load of Class V supplies plus radios, telephones and field wire for an NVA Infantry Bn in SVN is 3.41 tons.
- c. VC main force infantry units armed with the new family of 7.62mm weapons (30% or 15 bns) average about 485 men in strength (75% strength of NVA units in SVN).
- d. The Basic Load of Class V supplies plus radios, telephones and field wire of these VC main forces Infantry Bns is about 2.56 tons.
- e. The remaining VC main forces and VC local forces infantry bns are armed with a mixture of weapons and their basic load averages about 2.22 tons (65% strength of NVA units in SVN).
- f. There appears to be a goal to build all units to full strength and a trend to standardizing weapons.
- g. The strength, equipment, and basic load of Class V supplies for all VC and NVA Combat Support and Combat Service Support units appears comparable.
- h. Fire discipline is rigidly enforced throughout the VC and NVA units and ammunition expenditure is rigidly controlled through comprehensive accounting procedures.
- i. The capture of weapons and ammunition and the retricval of their own weapons and ammunition from the battlefield is of major concern to the combat forces.
- j. A detailed breakout of Class V supplies plus signal gear of VC/NVA units in SVN follows:

~~CONFIDENTIAL~~

<u>Units</u>	<u>Short Tons</u>
1 NVA Inf Bn	208.01
2 NVA Main Forces Bns (7.62 family equipped)	38.40
36 VC Main Forces Bns } Equipped with a 35 VC Local Forces Bns } mix of weapons	157.62
3 Arty Bns (6 NVA, 3 VC)	53.86
2 Mortar Bns (2 NVA, 2 VC)	2.52
1 Signal Bn (NVA)	2.10
1 Transportation Bn (NVA)	.25
1 Medical Bn (NVA)	.10
101 Separate Inf Platoons (VC)	8.74
173 Separate Inf Companies (VC)	68.54
Support Companies subordinate to the 32 Infantry Regiments (19 NVA, 13 VC)	171.84
6 Division Headquarters (4 NVA, 2 VC)	.6
Total Basic Load	712.58

Assuming the entire load of each VC/NVA unit is expanded every 30 days the average resupply requirement would be about 23* tons per day.

For all NVA units and the 30% of the VC main force units which are equipped with the 7.62mm family of weapons, the supply requirement from non-SVN sources would be about 10 tons per day.

The resupply requirement for remaining VC main forces and VC Local Forces would average 13 tons per day.

Resupply requirements computed by NIE 14.3 methodology (all units consume 1/3 their basic load every 30 days) would result in a total daily requirement for Class V of about 8 tons, with about 3 tons of this coming from external sources.

* All figures rounded off.
